

Excel Data Cleaning Report

Introduction

This report documents the process followed to clean and organize the given messy dataset in Microsoft Excel. The goal was to prepare the data for accurate analysis by applying various data cleaning techniques.

Data Cleaning Steps

Step	Action Taken	Example (Before -> After)
1	Autofit Columns & Rows	All columns adjusted for full visibility
2	Removed Duplicates	Row count reduced from 31 -> 28
3	Trimmed Extra Spaces	'Mike Tyson' -> 'Mike Tyson'
4	Eliminated Blank Cells	Empty 'Region' or 'Product' fields removed
5	Converted to Table	Data structured into an Excel table
6	Corrected Spelling Errors	'Excelent' -> 'Excellent'
7	Validated Ratings	Invalid -> 'Good', 'Excellent', 'Poor', 'Average'
8	Standardized Dates	Mixed formats -> YYYY-MM-DD
9	Fixed Invalid Prices	'inf' -> numeric value
10	Added Sales Column	Sales = Quantity × Price per Unit

Conclusion

The dataset is now free from duplicates, inconsistent formatting, extra spaces, blank cells, and incorrect values. It has been converted into a structured table with validated data, ready for analysis.
